

Package ‘RcppFarmHash’

August 2, 2021

Type Package

Title Interface to the Google 'FarmHash' Family of Hash Functions

Version 0.0.2

Date 2021-08-02

Author Dirk Eddelbuettel

Maintainer Dirk Eddelbuettel <edd@debian.org>

Description The Google 'FarmHash' family of hash functions is used by the Google 'BigQuery' data warehouse via the 'FARM_FINGERPRINT' function. This package permits to calculate these hash digest fingerprints directly from R, and uses the included 'FarmHash' files written by G. Pike and copyrighted by Google, Inc.

License GPL (>= 2)

Imports Rcpp (>= 1.0.7)

LinkingTo Rcpp

Suggests bit64

Author(s)

Dirk Eddelbuettel

farmhash *Compute a 'FarmHash' digest for a vector of strings*

Description

Compute a 'FarmHash' digest for a vector of strings

Usage

```
farmhash(sv)
```

Arguments

sv Vector of strings for which a hash digest is requested

Value

A vector of integer64 values (using the **bit64** package to 'decode' the appropriate binary payload from a numeric vector).

Examples

```
if (requireNamespace("bit64", quietly=TRUE)) {  
  suppressMessages(library(bit64))  
}  
farmhash(c("foo", "bar", "baz"))
```
