Package ‘kimfilter’

February 22, 2023

Type Package

Title Kim Filter

Version 1.0.1

Date 2023-02-01

Description 'Rcpp' implementation of the multivariate Kim filter, which combines the Kalman and Hamilton filters for state probability inference.
The filter is designed for state space models and can handle missing values and exogenous data in the observation and state equations.
Kim, Chang-Jin and Charles R. Nelson (1999) ``State-Space Models with Regime Switching: Classical and Gibbs-Sampling Approaches with Applications'' <http://econ.korea.ac.kr/ cjkim/doi:10.7551/mitpress/6444.001.0001><http://econ.korea.ac.kr/~{}cjkim/>.

R topics documented:

`contains` *Check if list contains a name*

Description

Check if list contains a name

Usage

```
contains(s, L)
```

Arguments

`s`	a string name
`L`	a list object

Value

boolean

`gen_inv` *Generalized matrix inverse*

Description

Generalized matrix inverse

Usage

```
gen_inv(m)
```

Arguments

`m`	matrix

Value

matrix inverse of m

`kimfilter` *Kim Filter*

Description

kimfilter Rcpp implementation of the multivariate Kim filter, which combines the Kalman and Hamilton filters for state probability inference. The filter is designed for state space models and can handle missing values and exogenous data in the observation and state equations. `browseVignettes("kimfilter")` to view it in your browser.

Author(s)

Alex Hubbard

`kim_filter` *Kim Filter*

Description

Kim Filter

Usage

```
kim_filter(ssm, yt, Xo = NULL, Xs = NULL, weight = NULL, smooth = FALSE)
```

Arguments

`ssm`	list describing the state space model, must include names B0 - N_b x 1 matrix, initial guess for the unobserved components P0 - N_b x N_b matrix, initial guess for the covariance matrix of the unobserved components Dm - N_b x 1 matrix, constant matrix for the state equation Am - N_y x 1 matrix, constant matrix for the observation equation Fm - N_b X p matrix, state transition matrix Hm - N_y x N_b matrix, observation matrix Qm - N_b x N_b matrix, state error covariance matrix Rm - N_y x N_y matrix, state error covariance matrix betaO - N_y x N_o matrix, coefficient matrix for the observation exogenous data betaS - N_b x N_s matrix, coefficient matrix for the state exogenous data Pm - n_state x n_state matrix, state transition probability matrix
`yt`	N x T matrix of data
`Xo`	N_o x T matrix of exogenous observation data
`Xs`	N_s x T matrix of exogenous state
`weight`	column matrix of weights, T x 1
`smooth`	boolean indication whether to run the backwards smoother

Value

list of cubes and matrices output by the Kim filter

Examples

```
#Stock and Watson Markov switching dynamic common factor
library(kimfilter)
library(data.table)
data(sw_dcf)
data = sw_dcf[, colnames(sw_dcf) != "dcoinc", with = FALSE]
vars = colnames(data)[colnames(data) != "date"]

#Set up the state space model
ssm = list()
ssm[["Fm"]] = rbind(c(0.8760, -0.2171, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0),

```

Rginv — *R's implementation of the Moore-Penrose pseudo matrix inverse*

Description

R's implementation of the Moore-Penrose pseudo matrix inverse

Usage

```
Rginv(m)
```

Arguments

m	matrix

Value

matrix inverse of m

self_rbind — *Matrix self rowbind*

Description

Matrix self rowbind

Usage

```
self_rbind(mat, times)
```

Arguments

`mat`	matrix
`times`	integer

Value

matrix

`ss_prob` *Finds the steady state probabilities from a transition matrix mat = |p_11 p_21 ... p_m1| |p_12 p_22 ... p_m2| |... ...| |p_1m p_2m ... p_mm| where the columns sum to 1*

Description

Finds the steady state probabilities from a transition matrix mat = |p_11 p_21 ... p_m1| |p_12 p_22 ... p_m2| |... ...| |p_1m p_2m ... p_mm| where the columns sum to 1

Usage

```
ss_prob(mat)
```

Arguments

`mat`	square SxS matrix of probabilities with column sums of 1. S represents the number of states

Value

matrix of dimensions Sx1 with steady state probabilities

Examples

```
library(kimfilter)
Pm = rbind(c(0.8406, 0.0304),
           c(0.1594, 0.9696))
ss_prob(Pm)
```

sw_dcf *Stock and Watson Markov Switching Dynamic Common Factor Data Set*

Description

Stock and Watson Markov Switching Dynamic Common Factor Data Set

Usage

```
data(sw_dcf)
```

Format

data.table with columns DATE, VARIABLE, VALUE, and MATURITY The data is monthly frequency with variables ip (industrial production), gmyxpg (total personal income less transfer payments in 1987 dollars), mtq (total manufacturing and trade sales in 1987 dollars), lpnag (employees on non-agricultural payrolls), and dcoinc (the coincident economic indicator)
