

Package ‘mrgsim.parallel’

July 6, 2020

Type Package

Title Simulate with 'mrgsolve' in Parallel

Version 0.1.1

Author Kyle Baron

Maintainer Kyle Baron <kylebtwin@imap.cc>

Description Simulation from an 'mrgsolve'

<<https://cran.r-project.org/package=mrgsolve>> model using a parallel backend.

Input data sets are split (chunked) and simulated in parallel using

mclapply() or future_lapply()

<<https://cran.r-project.org/package=future.apply>>.

License GPL (>= 2)

Imports parallel, dplyr, future.apply

Depends mrgsolve, R (>= 3.5.0)

Suggests testthat

Encoding UTF-8

LazyData true

chunk_data_frame	<i>Chunk a data frame</i>
------------------	---------------------------

Description

Use [chunk_by_id](#) to split up a data set by the ID column; use [chunk_by_row](#) split a data set by rows.

Usage

```
chunk_by_id(data, nchunk, id_col = "ID", mark = NULL)
```

```
chunk_by_row(data, nchunk, mark = NULL)
```

Arguments

data	a data frame
nchunk	number of chunks
id_col	character specifying the column containing the ID for chunking
mark	when populated as a character label, adds a column to the chunked data frames with that name and with value the integer group number

Value

A list of data frames

Examples

```
x <- expand.grid(ID = 1:10, B = rev(1:10))
```

```
chunk_by_id(x, 3)
```

```
chunk_by_row(x, nchunk = 4)
```

mrgsim.parallel	<i>Simulate with 'mrgsolve' in Parallel</i>
-----------------	---

Description

Simulate with 'mrgsolve' in Parallel

Resources

- GitHub: <https://github.com/kylebaron/mrgsim.parallel>
- Docs: <https://kylebaron.github.io/mrgsim.parallel>

Package options

- `mrgsim.parallel.mc.able`: if TRUE, multicore will be used if appropriate.

<code>parallel_mrgsim_d</code>	<i>Simulate a data set in parallel</i>
--------------------------------	--

Description

Use [future_mrgsim_d](#) to simulate with the future package. Use [mc_mrgsim_d](#) to simulate with `parallel::mclapply`.

Usage

```
future_mrgsim_d(  
  mod,  
  data,  
  nchunk = 4,  
  ...,  
  .as_list = FALSE,  
  .p = NULL,  
  .dry = FALSE,  
  .seed = TRUE,  
  .parallel = TRUE  
)
```

```
mc_mrgsim_d(  
  mod,  
  data,  
  nchunk = 4,  
  ...,  
  .as_list = FALSE,  
  .p = NULL,  
  .dry = FALSE,  
  .seed = NULL,  
  .parallel = TRUE  
)
```

```
fu_mrgsim_d(  
  mod,  
  data,  
  nchunk = 4,  
  ...,  
  .as_list = FALSE,  
  .p = NULL,  
  .dry = FALSE,  
  .seed = TRUE,  
)
```

```

    .parallel = TRUE
  )

  fu_mrgsim_d0(..., .dry = TRUE)

```

Arguments

<code>mod</code>	mrgsolve model object see mrgsolve::mrgmod
<code>data</code>	data set to simulate; see mrgsolve::data_set
<code>nchunk</code>	number of chunks in which to split the data set
<code>...</code>	passed to mrgsim_d
<code>.as_list</code>	if TRUE a list is return; otherwise (default) a data frame
<code>.p</code>	post processing function executed on the worker; arguments should be (1) the simulated output (2) the model object
<code>.dry</code>	if TRUE neither the simulation nor the post processing will be done
<code>.seed</code>	passed to future_lapply as <code>future.seed</code>
<code>.parallel</code>	if FALSE, the simulation will not be parallelized; this is intended for debugging and testing use only

Value

A data frame or list of simulated data

See Also

[future_mrgsim_ei](#)

Examples

```

mod <- mrgsolve::house()

data <- mrgsolve::expand.ev(amt = seq(10))

out <- future_mrgsim_d(mod,data, nchunk = 2)

```

parallel_mrgsim_ei *Simulate an idata set in parallel*

Description

Use [future_mrgsim_ei](#) to simulate with the future package. Use [mc_mrgsim_ei](#) to simulate with `parallel::mclapply`.

Usage

```
future_mrgsim_ei(  
  mod,  
  events,  
  idata,  
  nchunk = 4,  
  ...,  
  .as_list = FALSE,  
  .p = NULL,  
  .dry = FALSE,  
  .seed = TRUE,  
  .parallel = TRUE  
)  
  
fu_mrgsim_ei(  
  mod,  
  events,  
  idata,  
  nchunk = 4,  
  ...,  
  .as_list = FALSE,  
  .p = NULL,  
  .dry = FALSE,  
  .seed = TRUE,  
  .parallel = TRUE  
)  
  
fu_mrgsim_ei0(..., .dry = TRUE)  
  
mc_mrgsim_ei(  
  mod,  
  events,  
  idata,  
  nchunk = 4,  
  ...,  
  .as_list = FALSE,  
  .p = NULL,  
  .dry = FALSE,  
  .seed = NULL,  
  .parallel = TRUE  
)
```

Arguments

mod	mrgsolve model object see mrgsolve::mrgmod
events	an event object from mrgsolve; see mrgsolve::ev
idata	an idata set of parameters, one per simulation unit (individual); see mrgsolve::idata_set

<code>nchunk</code>	number of chunks in which to split the data set
<code>...</code>	passed to mrgsim_d
<code>.as_list</code>	if TRUE a list is return; otherwise (default) a data frame
<code>.p</code>	post processing function executed on the worker; arguments should be (1) the simulated output (2) the model object
<code>.dry</code>	if TRUE neither the simulation nor the post processing will be done
<code>.seed</code>	passed to future_lapply as <code>future.seed</code>
<code>.parallel</code>	if FALSE, the simulation will not be parallelized; this is intended for debugging and testing use only

Value

A data frame or list of simulated data

See Also

[future_mrgsim_ei](#)

Examples

```
mod <- mrgsolve::house()
events <- mrgsolve::ev(amt = 100)
idata <- data.frame(CL = runif(10, 0.5, 1.5))
out <- future_mrgsim_ei(mod, events, idata)
```
